I want to scrape all germination test conditions from tables and main text with the germination responses that occur and put into one common table including column for species name, germination test condition (such as cold stratification and soaking in different chemicals and water etc.) and the response including the response variable (such as percent germination or days to germination etc.) and the value of the response variable. Thank you!
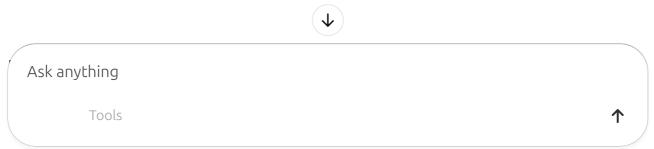

Thought for a second ›

Here is the compiled table of germination test conditions and responses for various Magnolia species, including the test condition details, the response variable (e.g., germinative capacity), and the corresponding values. Let me know if you'd like to export or expand this dataset further. ⟨›-⟩

⧉ ◁» ⟳⌄

This isn't all the information in the document. Go back through, check every table, and look for information in the text as well, and add that to a larger table.
